## Conditions for small perturbations

We consider the transformation  $\underline{x} = \underline{\Phi}(\underline{X}, t)$  defined by:

$$x_1 = X_1 + X_2 (1)$$

$$x_2 = X_2 \tag{2}$$

$$x_3 = X_3 \tag{3}$$

**Question 1:** Make a graphical representation of the reference configuration and of the deformed configuration. Calculate the gradient of the transformation,  $\underline{F}$ .

**Question 2:** Is this an homogenous transformation? It is acceptable from a physical point of view?

Question 3: Calculate the expansion of the following vectors:  $\underline{e}_1$ ,  $\underline{e}_2$  and  $\frac{\underline{e}_1 + \underline{e}_2}{\sqrt{2}}$ 

**Question 4:** Calculate  $\underline{e}$  and  $\underline{\varepsilon}$ ? Can we consider we are in small perturbations?

**Question 5:** Consider the transformation  $x_1 = X_1 + \alpha \cdot X_2$ ,  $x_2 = X_2$  and  $x_3 = X_3$ . What is the condition for having small perturbations?
